

When winter weather hits and your porch steps, sidewalks, and driveways ice up, you want to know that you won't slip and fall unexpectedly. You want to go out and buy some ice melter, but which kind should you get? There are so many! At Benedict's, we mainly sell six different kinds of ice melter. Here is a little about each of them.

Polar Express

- A blend of sodium, calcium, magnesium, and potassium chloride.
- Low temperature ice melter—to -15 degrees
- Safer than rock salt
- 2-4 oz. per square yard

Qik Joe Calcium Chloride

- Pellet or flake form
- Actually gives off heat when dissolving
- Low temperature ice melter—to -25 degrees
- Moderately corrosive but okay on concrete
- 2-4 oz. per square yard

Magnesium Chloride

- Less harmful to the environment, concrete, pets, and people
- Leaves no residue, as it is completely soluble
- Lasts longer than other ice melt products

Ice Cutter

- Will not harm vegetation, carpets, or flooring.
- Does not leave any white residue
- Will not harm concrete
- A mix of Sodium Chloride, Potassium Chloride, and Urea

Agway Premium Ice Melter

- A mix of Magnesium Chloride and Sodium Chloride
- Safer than plain Sodium or Potassium
- Safe for vegetation

Rock Salt

- Contains Sodium Chloride
- High temperature ice melter—to +20 degrees
- Do not use on anything but asphalt
- Can injure animals
- Economical
- 8 oz. per square yard

Once you have chosen the ice melter that is right for you, simply spread it on your icy areas and let it do the job for you! It's always a good idea to avoid walking on the area until it begins to melt, as you can track the ice melter into your home and possibly damage your carpets or flooring.
